#### 梗槪

本論文では(Friedman による)ギャップ条件を持つ Kruskal の定理の無限 木 (ω 木) 上への拡張を証明する。これに基づき(概念的に無限項をあらわ すことのできる)循環項上の項グラフ書換え系上の停止性の十分条件として、 単純ギャップ停止性を提案する。

# Simple gap termination on term graph rewriting systems

Mizuhito Ogawa mizuhito@theory.brl.ntt.jp NTT Basic Research Labolatories

#### Abstract

This paper proves the Kruskal-type theorem with gap-condition (á la Friedman) on infinite trees ( $\omega$ -trees). As an application, it also proposes a termination criteria, named *simple gap termination*, for term graph rewriting systems (on possibly cyclic terms), where the naive extension of simple termination [Der82] (based on [Lav78]) does not work well for term graph rewriting systems.

#### 1 Better-Quasi-Order

**Definition 1.1** Let  $\omega$  be the least countable ordinal (i.e., set of natural numbers). If  $s, t \subseteq \omega$ , then  $s \le t$  (s < t) means that s is a (proper) initial segment of t. Define  $s \triangleleft t$  to hold if there is an n > 0 and  $i_0 < \cdots < i_n < \omega$  s.t. for some m < n,  $s = \{i_0, \cdots, i_m\}$  and  $t = \{i_1, \cdots, i_n\}$ . (Thus, e.g.,  $\{3\} \triangleleft \{5\}$ ,  $\{3,5,6\} \triangleleft \{5,6,8,9\}$ ,  $\{3,5,6\} \not A\{5,6\}$ .)

**Definition 1.2** For an infinite set  $X \subseteq \omega$ , a barrier B on X is a set of finite sets of X s.t.  $\phi \notin B$  and

- 1. for every infinite set  $Y \subseteq \omega$  there is an  $s \in B$  s.t. s < Y.
- 2. if  $s, t \in B$  and  $s \neq t$  then  $s \not\subset t$ .

**Theorem 1.1** If B is a barrier and  $B = \bigcup_{i \leq n} B_i$  for some  $n < \omega$ , then some  $B_i$  contains a barrier (on  $\bigcup_{b \in B_i} b$ ).

**Definition 1.3** Let  $\leq$  be a transitive binary relation on a set Q. Then,

- If  $\leq$  is reflexive, R is called a quasi-order (QO).
- If  $\leq$  is antisymmetric, R is called a partial order (or, simply order).
- If each pair of different elements in Q is comparable by  $\leq$ ,  $\leq$  is said to be total.

A strict part of  $\leq$  is  $\leq -\geq$  and denoted as <. We also say a strict (quasi) order < if it is a strict part of a (quasi) order  $\leq$ . When  $\leq$  is a QO, we will sometimes use  $\leq$  (resp.  $\prec$ ) instead of  $\leq$  (resp. <), for clarity.

**Definition 1.4** Let  $\leq$  be a QO on Q. If B is a barrier,  $f: B \to Q$  is good if there are  $s, t \in B$  s.t.  $s \triangleleft t$  and  $f(s) \leq f(t)$ , and f is bad otherwise. f is perfect if for all  $s, t \in B$ , if  $s \triangleleft t$  then  $f(s) \leq f(t)$ . Q is better-quasi-ordered (bqo) if for every barrier B and every  $f: B \to Q$ , f is good.

Remark 1.1 If we restrict the BQO definition s.t. B runs only barriers of singleton sets (i.e.,  $B = \{1, 2, \dots\}$ , etc.), then we get the familiar well-quasi-order (WQO) definition. Note that (1) a well order is a BQO and a BQO is a WQO, and (2) if Q is finite then Q is BQO for any QO < [Lav78].

A (possibly infinite) tree is a set of T on which a strict partial order  $<_T$  is defined s.t. for every  $t \in T$ ,  $\{s \in T \mid s <_T t\}$  is well ordered under  $<_T$ . Thus  $T = \cup_{\alpha} T_{\alpha}$  where  $\alpha$  runs on ordinals and  $T_{\alpha}$ , the  $\alpha$ -th level of T, is the set of all  $t \in T$  s.t.  $\{s \mid s <_T t\}$  has type  $\alpha$ . The height of T is the least  $\alpha$  with  $T_{\alpha} = \phi$ . A path in T is a linearly ordered downward closed subset of T. If  $x \in T$  (resp. a path P in T), let S(x) (resp. S(P)) be the set of immediate successors of x (resp. P). A path is maximal in T if  $S(P) = \phi$ . Let  $br_T(x)$  (or simply br(x) if unambiguous) be  $\{y \in T \mid x \leq_T \}$ , the branch above x. An  $\omega$ -tree is a (possibly infinitely branching) tree of the height at most  $\omega$ .

#### **Definition 1.5** Let $\mathcal{T}$ be a set of trees which satisfies

- 1. For each  $T \in \mathcal{T}$ , T has a root (minimum element),
- 2. For each  $T \in \mathcal{T}$ , if P is a path in T with no largest element then  $Card(S(P)) \leq 1$ . A Q-tree  $\mathcal{T}_Q$  is a pair (T,l) where  $T \in \mathcal{T}$  and  $l: T \to Q$ .

If  $T \in \mathcal{T}$ ,  $s, t \in \mathcal{T}$ , there is a greatest lower bound of s and t in T, denoted by  $s \wedge t$ .

**Definition 1.6** Let Q be a QO set and  $(T_1, l_1), (T_2, l_2) \in \mathcal{T}_Q$ .  $(T_1, l_1)$  is embeddable to  $(T_2, l_2)$  (and denoted  $(T_1, l_1) \leq (T_2, l_2)$ , or simply  $T_1 \leq T_2$ ) if there exists  $\psi : T_1 \to T_2$  s.t.

- 1. For  $s, t \in T_1$ ,  $\psi(s \wedge t) = \psi(s) \wedge \psi(t)$ ,
- 2. For  $t \in T_1$ ,  $l_1(t) < l_2(\psi(t))$ .

<sup>&</sup>lt;sup>1</sup>Corollary 1.5 in [Lav78]. The proof is due to Galvin-Prikry. See Theorem 9.9 in [Sim85a].

**Theorem 1.2** [Lav78, NW65] If Q is BQO,  $\mathcal{M}_Q$  is BQO wrt the embedability  $\leq$ .

WQO is not enough for Kruskal-type theorem for infinite objects. For instance, consider  $Q = \{(i,j) \mid i < j < \omega\}$  ordered by  $(i,j) \leq (k,l)$  if and only if either i = k wedge  $j \leq k$  or j < k. Then Q is WQO, but a set  $Q^{\omega}$  of infinite sequence on Q is not WQO, namely,

$$\begin{array}{rcl} f_1 & = & \langle (0,1), (1,2), (1,3), (1,4), \cdots \rangle, \\ f_2 & = & \langle (0,1), (1,2), (2,3), (2,4), \cdots \rangle, \\ \vdots & = & \vdots \\ \vdots & = & \langle (0,1), \cdots, (i,i+1), (i,i+2), (i,i+3), \cdots \rangle, \\ \vdots & \vdots & \vdots \end{array}$$

The main techniques to prove Kruskal-type theorems are (1) Ramsey-like theorem and (2) the existence of the minimal bad sequence (MBS). For (1), theorem 1.1 works. For (2), we first prepare some definitions (See [Lav78]).

Suppose Q is quasi-ordered by  $\leq$ . A partial ranking on Q is a well-founded (irreflexive) Definition 1.7 partial order <' on Q s.t. q <' r implies q < r. If B and C are barriers, then  $B \sqsubseteq C$  if

- 1.  $\cup C \subseteq \cup B$ , and
- 2. for each  $c \in C$  there is a  $b \in B$  with  $b \le c$ .

 $B \sqsubset C$  if  $B \sqsubseteq C$  and there are  $b \in B$ ,  $c \in C$  with b < c. For  $f: B \to Q$ ,  $g: C \to Q$  and a partial ranking <' on Q,  $f \sqsubseteq g$  ( $f \sqsubseteq g$ ) wrt <' if  $B \sqsubseteq C$  ( $B \sqsubseteq C$ ) and

- 1. g(a) = f(a) for  $a \in B \cap C$ ,
- 2. q(c) < f(b) for  $b \in B$ ,  $c \in C$  s.t. b < c.

**Definition 1.8** Suppose <' is a partial ranking on Q. For a barrier  $C, g: C \to Q$  is minimal bad if g is bad and there is no bad h with  $g \sqsubset h$ .

**Theorem 1.3** Let Q be quasi-ordered by  $\leq$ , <' a partial ranking on Q. Then for any bad f on Q there is minimal bad g s.t.  $f \sqsubseteq g$ .

Thus, the proof of Kruskal-type theorem on infinite objects is reduced to find some appropriate partial ranking <'.

#### 2 Kruskal-type theorems with gap-condition on infinite trees

Let  $\mathcal{M}_n$  be a set of  $\omega$ -trees on which each vertex is labeled by an element of n (=  $\{0,1,\cdots,n-1\}$ ), and  $(T_1,l_1),(T_2,l_2)\in\mathcal{M}_n$  for some  $n<\omega$ .  $(T_1,l_1)\leq_G(T_2,l_2)$  if there exists  $\psi:T_1\to T_2$ 

- 1.  $T_1 \leq T_2$ ,
- 2. For each  $t \in T_1$ ,  $l_1(t) = l_2(\psi(t))$ ,
- 3. For  $t \in T_1$ , if there is  $t' \in T_1$  s.t.  $t \in S(t')$  then  $l_2(s) \ge l_1(t)$  for each s s.t.  $\psi(t') <_{T_2} s <_{T_2} \psi(t)$ ,
- 4. For the root t of  $T_1$ ,  $l_2(s) \ge l_1(t)$  for each s s.t.  $s <_{T_2} \psi(t)$ .

**Theorem 2.1** [Sim85b] For  $n < \omega$ , T(n) is the set of all finite trees with labels less-than-equal n. Then  $\leq_G$  is a WQO on the set T(n).

Kruskal's theorem with gap-condition for finite trees have been proposed for finite ordinals[Sim85b]. There are two variants of its extensions for infinite ordinals[K89, Gor90]. The main theorem is following:

<sup>&</sup>lt;sup>2</sup>Theorem 1.9 in [Lav78], or equivalently theorem 9.17 in [Sim85a].

**Theorem 2.2** Let  $\mathcal{M}_n$  be a set of  $\omega$ -trees on which each vertex is labeled by an element of  $n (= \{0, 1, \dots, n-1\})$  for some  $n < \omega$ . Then  $\mathcal{M}_n$  is BQO wrt  $\leq_G$ .

To show the theorem, we will prove the slightly stronger statement.

**Definition 2.2** Let  $n = \{0, 1, \dots, n-1\} < \omega$ . Let Q be a QO and  $q: Q \to n$ . Let  $\mathcal{M}_n(Q)$  be a set of  $\omega$ -trees satisfying: for  $(T, l) \in \mathcal{M}_n(Q)$ 

- 1.  $l(t) \in n$  for each interior vertex t of T.
- 2.  $l(t) \in n \cup Q$  for each end vertex t of T.

 $(T_1, l_1) \leq_{\bar{G}} (T_2, l_2)$  if there exists  $\psi: T_1 \to T_2$  s.t.

- 1.  $T_1 < T_2$
- 2. For each interior vertex  $t \in T_1$ ,  $\psi(t)$  is an interior vertex of  $T_2$  and  $l_1(t) = l_2(\psi(t))$ ,
- 3. For each end vertex  $t \in T_1$ ,  $\psi(t)$  is an end vertex of  $T_2$  and either  $l_1(t) = l_2(\psi(t)) \in n$  or  $l_1(t) \le l_2(\psi(t)) \in Q$ .
- 4. For each interior vertex  $t \in T_1$ ,  $t' \in S(t)$  and  $s \in T_2$  with  $\psi(t) <_{T_2} s <_{T_2} \psi(t')$ ,  $l_2(s) \ge l_1(\psi(t'))$  when  $l_1(\psi(t')) \in R$  and  $l_2(s) \ge q(l_1(\psi(t')))$  when  $l_1(\psi(t')) \in Q$ .
- 5. For the root t of  $T_1$  and  $s \in T_2$  s.t.  $s <_{T_2} \psi(t), l_2(s) \ge l_1(\psi(t))$  when  $l_1(\psi(t)) \in n$  and  $l_2(s) \ge q(l_1(\psi(t)))$  when  $l_1(\psi(t)) \in Q$ .

We will denote  $(T_1, l_1) \equiv (T_2, l_2)$  if  $(T_1, l_1) \leq_{\tilde{G}} (T_2, l_2)$  and  $(T_1, l_1) \geq_{\tilde{G}} (T_2, l_2)$ 

**Theorem 2.3** Let  $n < \omega$ , Q be a BQO and  $q: Q \to n$  (=  $\{0, 1, \dots, n-1\}$ ). Let  $\mathcal{M}_n(Q)$  be a set of  $\omega$ -trees on which each vertex is labeled by an element of n. Then  $\mathcal{M}_n(Q)$  is BQO wrt  $\leq_{\widetilde{G}}$ .

**Definition 2.3** Let  $n < \omega$ . Let Q be a QO and  $q: Q \to n$ .  $\mathcal{W}_n(Q), \mathcal{S}_n(Q), \mathcal{F}_n(Q) \subseteq \mathcal{M}_n(Q)$  are defined to be:

- 1.  $\mathcal{W}_n(Q)$  is a set of  $\omega$ -words in  $\mathcal{M}_n(Q)$ .
- 2.  $S_n(Q)$  is a set of scattered  $\omega$ -trees in  $\mathcal{M}_n(Q)$ . (i.e., for each  $(S,l) \in S_n(Q)$   $\eta \not\leq S$  where  $\eta$  is a complete binary  $\omega$ -tree  $(2)^{\omega}$ .)
- 3.  $\mathcal{F}_n(Q)$  is a set of descensionally finite trees. (i.e., For  $(T,l) \in \mathcal{F}_n(Q)$ , there is no infinite sequence  $x_0 <_T x_1 <_T \cdots$  with  $(b\tau(x_0),l) >_{\bar{G}} (b\tau(x_1),l) >_{\bar{G}} \cdots$ )

The proof of theorem 2.3 consists of four steps: First,  $\mathcal{W}_n(Q)$  is shown to be a BQO wrt  $\leq_{\tilde{G}}$  (theorem 2.4). Second,  $\mathcal{S}_n(Q)$  is shown to be a BQO wrt  $\leq_{\tilde{G}}$  (theorem 2.5). During this step, the principle tool is a recursive construction of  $\mathcal{S}_n(Q)$  starts with one-points trees in  $\mathcal{M}_n(Q)$ ) using an element in  $\mathcal{W}_n(Q)$  as a *spine*.

 $T \in \mathcal{M}_n(Q)$ ) is a finite union of scattered  $\omega$ -trees, i.e.,  $T = \cup_i S_i$  with  $S_i \in \mathcal{S}_n(Q)$ . Using this decomposition, thirdly  $\mathcal{F}_n(Q)$  is shown to be a BQO wrt  $\leq_{\widetilde{G}}$  (theorem 2.6). Again using this decomposition, lastly  $\mathcal{M}_n(Q)$ ) =  $\mathcal{F}_n(Q)$  is shown (theorem 2.7).

**Theorem 2.4** Let  $n < \omega$ . For a barrier D,  $g: D \to \mathcal{W}_n(Q)$  is bad wrt  $\leq_{\tilde{G}}$ , then there is a barrier E and  $g \sqsubseteq j$  s.t.  $j: E \to Q$  is bad.

**Proof** Assume g is minimal bad wrt a partial ranking <' on  $\mathcal{W}_n(Q)$  where J <' K if and only if  $J \leq_G K$  and dom(J) < dom(K). From theorem 1.1, we can assume  $\forall d \in D$  s.t. either (1) dom(g(d)) = 1, (2)  $dom(g(d)) < \omega$ , or (3)  $dom(g(d)) = \omega$ .

For (1), there exists a barrier  $E(\subseteq D)$  s.t.  $g(e) \in Q$  for  $e \in E$ . By taking  $j = g|_E$ , theorem is proved. For (2), we will prove by induction on n. Again by theorem 1.1, we can assume  $\forall d \in D$  s.t. either (2-a) g(d) does not contain 0, (2-b) the first element of g(d) is 0, or (2-c) g(d) contains 0 and the first element of g(d) is not 0. For (2-a), by subtracting 1 from each label of g(d), it is reduced to the induction hypothesis. For (2-b), let g'(d) be obtained from g(d) by taking the first element. Then, g'(d) is bad and this contradicts to the minimal bad assumption of g. For (2-c), let  $g(d) = (g_1(d), g_2(d))$ . Since  $g_1(d)$  and  $g_2(d)$  are good from the minimal bad assumption of g, there is a barrier E s.t.  $g_1(d)$  and  $g_2(d)$  are perfect. This implies that g(d) is good.

For (3), if  $g(d_1) \not\leq_{\tilde{G}} g(d_2)$  with  $d_1 \triangleleft d_2$ , there exists an initial segment J s.t.  $J \not\leq_{\tilde{G}} g(d_2)$ . Let  $h: D(2) \to (n)^{<\omega}$  by  $h(d_1 \cup d_2) = J$ . Then  $g \sqsubset h$  contradicts to the minimal bad assumption on g.

**Definition 2.4** Let  $T \in \mathcal{T}$ , P a path in T,  $z \in P$ . Then let  $\tilde{P}(z) = \{br(y) \mid y \in S(z) \text{ and } y \notin P\}$ .

**Lemma 2.1** (lemma 2.1 in [Lav78]) Let  $n < \omega$  and Q be a QO. Let  $\alpha$  be an ordinal and  $\lambda$  be a limit ordinal. Let

$$S^{0}(Q) = \begin{cases} \text{the empty tree} \} \cup n \cup Q \\ S^{\alpha+1}(Q) = \begin{cases} T \mid \text{there is a maximal path } P \in W_n(Q) \text{ in } T \\ \text{s.t. } \tilde{P}(z) \subseteq S^{\alpha}(Q) \text{ for all } z \in P \end{cases}$$

$$S^{\lambda}(Q) = \bigcup_{\alpha \leq \lambda} S^{\alpha}.$$

by regarding n, Q as one point trees. Then  $S_n(Q) = \bigcup_{\alpha} S^{\alpha}(Q)$ . We say rank(T) for  $T \in S_n(Q)$  be the least  $\alpha$  s.t.  $T \in S^{\alpha}(Q)$ .

**Theorem 2.5** Let  $n < \omega$ . For a barrier C,  $g: C \to \mathcal{S}_n(Q)$  is bad wrt  $\leq_{\widetilde{G}}$ , then there is a barrier E and  $g \sqsubseteq j$  s.t.  $j: E \to Q$  is bad.

**Proof** Let a partial ranking <' on  $S_n(Q)$  be  $(T_1,l_1)<'(T_2,l_2)$  if  $(T_1,l_1)\leq_{\bar{G}}(T_2,l_2)$  and  $rank(T_1)< rank(T_2)$ . Assume g is minimal bad wrt a partial ranking <' on  $S_n(Q)$ . From theorem 1.1, we can assume  $\forall d \in C$  s.t. either (1) card(g(d)) = 1 or (2) card(g(d)) > 1. For (1), there exists a barrier  $E(\subseteq C)$  s.t.  $g(e) \in Q$  for  $e \in E$ . By taking  $j = g|_E$ , theorem is proved.

For (2), let  $c \in C$ . Let  $P_c$  be a maximal path in  $T_c$  where  $g(c) = (T_c, l_c) \in \mathcal{S}_n(Q)$  s.t. for each  $x \in P_c$  and each  $T' \in \tilde{P}_c(x)$  rank $(T') < rank(T_c)$ . Let  $J_c : P_c \to \mathcal{W}_{n+1}(Q) \times \mathcal{P}(\mathcal{S}_n(Q))$  be defined by

$$J_c = (I_c(x), \tilde{P}_c(x))$$

where  $I_c(x)$  is the sequence which is obtained by adding n+1 as the maximal element (wrt  $<_{T_c}$ ) to the path from the root of  $T_c$  to x. By regarding  $J_c$  as a sequence,  $J_c \leq J_d$  (embedability without gap-condition) implies  $(T_c, l_c) \leq (T_d, l_d)$  for  $c, d \in C$ . From theorem 1.10 in [Lav78], if g is bad, there is a barrier D and  $\bar{g}: D \to \mathcal{W}_{n+1}(Q) \times \mathcal{P}(S_n(Q))$  s.t.  $g \sqsubseteq \bar{g}$  and  $\bar{g}$  is bad (by identifying an element as a sequence of the length 1). From theorem 2.4 and theorem 1.11 in [Lav78] (with  $\leq_1$  on  $\mathcal{P}(S_n(Q))$ , which is an one-to-one embedability on sets), there exists a barrier E and  $j: E \to \mathcal{W}_{n+1}(Q) \times S_n(Q)$  s.t.  $D \subseteq E$  and j is bad. For  $j(e) = (I_c(x), T')$  where  $x \in P_e \subseteq T_c$  and each  $T' \in \bar{P}_c(x)$  for  $c \sqsubseteq e$ , let j'(e) be a tree obtained by replacing the last element of  $I_c(x)$  (whose label is n+1) with T'.  $g \sqsubseteq j'$  and  $rank(j'(e)) < rank(T_c)$  (since  $rank(T') < rank(T_c)$  and adding a sequence to the root of T' does not change its rank). This contradicts to the minimal bad assumption of g.

Adding (possibly infinite numbers of) finite trees to  $(S,l) \in \mathcal{S}_n(Q)$  does not exceed the class of  $\mathcal{S}_n(Q)$ . Thus without loss of generality, for each  $(T,l) \in \mathcal{M}_n(Q)$  we can assume the decomposition  $T = \cup_i T_i$  with  $(T_i,l) \in \mathcal{S}_n(Q)$  satisfies that if x is maximal wrt  $<_{T_i}$  then either br(x) does not contain 0 or l(x) = 0.

**Definition 2.5** Let  $(T,l) \in \mathcal{F}_n(Q) \subseteq \mathcal{M}_n(Q)$  and  $T = \cup_i T_i$  with  $(T_i,l) \in \mathcal{S}_n(Q)$  s.t. if  $x \in T_i$  is maximal wrt  $<_{T_i}$  then either br(x) does not contain 0 or l(x) = 0. If T does not contain a vertex labeled 0,  $subt(T,l) \in \mathcal{F}_{n-1}(Q)$  is (T,l') where l'(x) = l(x) - 1 for each  $x \in T$ . With a fresh symbol  $\Omega$ , let  $Q^+ = Q \cup \{\Omega\}$  with  $q(\Omega) = 0$  3. We denote  $\mathcal{F}_n(Q)^{<(T,l)} = \{(U,m) \in \mathcal{F}_n(Q) \mid (U,m) <_{\bar{G}}(T,l)\}$ . Define  $A_{(T,l)}(i) = (\bar{T}_i,\bar{l}) \in \mathcal{S}_{n+1}(Q^+ \cup \mathcal{F}_{n-1}(Q) \cup \mathcal{F}_n(Q)^{<(T,l)})$  where

- 1. If  $x \in T_i$  is not maximal wrt  $<_{T_i}$ , then  $\bar{l}(x) = l(x)$ .
- 2. If  $x \in T_i$  is maximal wrt  $<_{T_i}$  and (br(x), l) does not contain 0, then add a new vertex  $x^+$  below x and set  $\bar{l}(x) = n + 1$ ,  $\bar{l}(x^+) = subt(br(x), l)$ .
- 3. If  $x \in T_i$  is maximal wrt  $<_{T_i}$ , l(x) = 0 and  $(br(x), l) <_{\bar{G}} (T, l)$ , then  $\bar{l}(x) = (br(x), l)$ .
- 4. If  $x \in T_i$  is maximal wrt  $<_{T_i}$ , l(x) = 0 and  $(br(x), l) \equiv (T, l)$ , then  $\bar{l}(x) = \Omega$ .

Define  $A((T,l)) = \{A_{(T,l)}(i) \mid i < \omega\} \in \mathcal{P}(S_{n+1}(Q^+ \cup \mathcal{F}_{n-1}(Q) \cup \mathcal{F}_n(Q)^{<(T,l)}))$ . For  $(T,l),(U,m) \in \mathcal{F}_n(Q)$ , define  $A((T,l)) \leq A((U,m))$  if for each  $A_{(T,l)}(i) \in A((T,l))$  there exists  $A_{(U,m)}(j) \in A((U,m))$  s.t.  $A_{(T,l)}(i) \leq_G A_{(U,m)}(j)$ .

<sup>&</sup>lt;sup>3</sup> If Q is a BQO,  $Q^+$  is also a BQO.

**Lemma 2.2** For  $(T,l),(U,m)\in\mathcal{F}_n(Q), A((T,l))\leq A((U,m))$  implies  $(T,l)\leq_{\tilde{G}}(U,m)$ .

**Proof** We will construct an embedding  $H:(T,l)\to (U,m)$  (with gap-condition) in  $\omega$  steps. The induction hypothesis is:

If  $x \in T_i$  is maximal wrt  $<_{T_i}$ , there is a 1-1 function  $J_i$  s.t.

- 1. if (br(y), l) does not contain 0 then  $(br(y), l) \leq_{\bar{G}} (br(J_i(y)), m)$ ,
- 2. if l(y) = 0 and  $(br(y), l) <_{\mathcal{C}} (T, l)$  then  $m(J_i(y)) = 0$  and  $(br(y), l) <_{\mathcal{C}} (br(J_i(y)), m)$ ,
- 3. if l(y) = 0 and  $(br(y), l) \equiv (T, l)$  then  $m(J_i(y)) = 0$  and  $(br(J_i(y)), m) \equiv (U, m)$ .

Since  $A((T,l)) \leq A((U,m))$ , there exists  $A_{(U,m)}(j) \in A((U,m))$  s.t.  $A_{(T,l)}(0) = (\bar{T}_0,\bar{l}) \leq_{\bar{G}} A_{(U,m)}(j) = (\bar{U}_j,\bar{m})$ . Then set  $H_0$  by the embedding  $T_0 \to U_j$ .

Suppose that  $H_i$  has been defined,  $y \in T_i$  is maximal. If either (1) (br(y), l) does not contain 0 or (2) l(y) = 0 and  $(br(y), l) <_{\bar{G}} (T, l)$  then  $(br(y), l) \le_{\bar{G}} (br(J_i(y)), m)$ . Thus extend  $H_i$  with an embedding of br(y) into  $br(J_i(y))$ .

Suppose that (3) l(y) = 0 and  $(br(y), l) \equiv \bar{G}(T, l)$  then there exists an embedding  $L: (U, m) \rightarrow (br(J_i(y)), m)$ . Since  $A((T, l)) \leq A((U, m))$ , there exists  $A_{(U,m)}(j) \in A((U,m))$  s.t.  $A_{(T,l)}(i+1) = (\bar{T}_{i+1}, \bar{l}) \leq \bar{G}$   $A_{(U,m)}(j) = (\bar{U}_j, \bar{m})$ . Let  $K: (T_{i+1}, l) \rightarrow (U_j, m) \subseteq (U, m)$  be an induced embedding. Thus extend  $H_i$  on  $br(y) \cap T_{i+1}$  with LK. Since L isomorphically embeds (U, m) into  $(br(J_i(y)), m)$ , the induction hypothesis is satisfied to the next stage.

**Theorem 2.6** Let  $n < \omega$ . For a barrier  $B, f: B \to \mathcal{F}_n(Q)$  is bad wrt  $\leq_{\bar{G}}$ , then there is a barrier E and  $f \subseteq j$  s.t.  $j: E \to Q$  is bad. Thus if Q is a BQO then  $\mathcal{F}_n(Q)$  is a BQO (wrt  $\leq_{\bar{G}}$ ).

**Proof** We will prove by induction on n. For n = 0,  $\leq_C$  and  $\leq$  (without gap-condition) are equivalent (see lemma 2 in theorem 2.4 of [Lav78]). Assume the theorem has been proved until n - 1.

Define a partial ranking <' by: (U,m) <' (T,l) if and only if for some  $x \in T$   $(U,m) = (br(x),l) <_{\bar{G}}(T,l)$ . By theorem 1.3, we can assume  $f: B \to \mathcal{F}_n(Q)$  is minimal bad. Let  $f(b) = (T_b,l_b)$  for  $b \in B$  and let  $\bar{f}(b) = A((T_b,l_b))$ . From lemma 2.2,  $\bar{f}$  is bad. From lemma 1.3 in [Lav78], there is a barrier  $C \subseteq B(2)$  and an g defined on C s.t. for  $c \in C$   $(c = b_1 \cup b_2 \text{ where } b_1 \triangleleft b_2 \text{ and } b_1, b_2 \in B)$   $g(c) \in \bar{g}(b_1)$  and g is bad. Since  $g(c) \in \mathcal{S}_{n+1}(Q^+ \cup \mathcal{F}_{n-1}(Q) \cup \mathcal{F}_n(Q)^{<(T_b,l_b)})$  and g is bad, from theorem 2.5 there is a barrier D with  $C \subseteq D$  and D defined on D s.t. D and D is bad. Since D and D are BQO, from theorem 1.1 there is a barrier D and D defined on D s.t. D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO, from theorem 1.1 there is a barrier D and D are BQO.

#### Theorem 2.7 $\mathcal{M}_n(Q) = \mathcal{F}_n(Q)$ .

We will prove theorem 2.7 by induction on n. For  $n=0, \leq \text{and } \leq_{\bar{G}}$  are equivalent and this is shown by lemma 4 in theorem 2.4 in [Lav78]. Note that if  $(T,l) \in \mathcal{M}_n(Q)$  does not contain 0, by induction hypothesis  $subt(T,l) \in \mathcal{M}_{n-1}(Q) = \mathcal{F}_{n-1}(Q)$ , and  $(T,l) \in \mathcal{F}_n(Q)$ .

**Definition 2.6** Let  $(T,l) \in \mathcal{M}_n(Q)$  and  $T = \cup_i T_i$  with  $(T_i,l) \in \mathcal{S}_n(Q)$  s.t. if  $x \in T_i$  is maximal wrt  $<_{T_i}$  then either br(x) does not contain 0 or l(x) = 0. Let  $Q^+ = Q \cup \{\Omega\}$  with  $q(\Omega) = 0$ . Define  $B_{(T,l)}(i) = (\bar{T}_i,\bar{l}) \in \mathcal{S}_{n+1}(Q^+ \cup \mathcal{F}_n(Q))$  where

- 1. If  $x \in T_i$  is not maximal wrt  $<_{T_i}$ , then  $\bar{l}(x) = l(x)$ .
- 2. If  $x \in T_i$  is maximal wrt  $<_{T_i}$  and (br(x), l) does not contain 0, then add a new vertex  $x^+$  below x and set  $\overline{l}(x) = n + 1$ ,  $\overline{l}(x^+) = (br(x), l)$ .
- 3. If  $x \in T_i$  is maximal wrt  $<_{T_i}$ , l(x) = 0 and  $br(x) \in \mathcal{F}_n(Q)$ , then  $\bar{l}(x) = (br(x), l)$ .
- 4. If  $x \in T_i$  is maximal wrt  $<_{T_i}$ , l(x) = 0 and  $(br(x), l) \in \mathcal{M}_n(Q) \mathcal{F}_n(Q)$ , then  $\bar{l}(x) = \Omega$ .

Define  $B((T,l)) = \{B_{(T,l)}(i) \mid i < \omega\} \in \mathcal{P}(\mathcal{S}_{n+1}(Q^+ \cup \mathcal{F}_n(Q))) \text{ For } (T,l), (U,m) \in \mathcal{M}_n(Q) - \mathcal{F}_n(Q), \text{ define } B((T,l)) \leq B((U,m)) \text{ if for each } B_{(T,l)}(i) \in B((T,l)) \text{ there exists } B_{(U,m)}(j) \in B((U,m)) \text{ s.t. } B_{(T,l)}(i) \leq_{\bar{G}} B_{(U,m)}(j).$ 

**Lemma 2.3** Let  $(T,l),(U,m) \in \mathcal{M}_n(Q) - \mathcal{F}_n(Q)$  s.t. l(root(T)) = m(root(U)) = 0. If  $B((T,l)) \leq B((br(u),m))$  for each  $u \in U$  s.t. m(u) = 0 and  $(br(u,m)) \notin \mathcal{F}_n(Q)$ , then  $(T,l) \leq_G (U,m)$ .

**Proof** We will construct an embedding  $I:(T,l)\to (U,m)$  (keeping gap-condition) in  $\omega$  steps. The induction hypothesis is:

If  $x \in T_i$  is maximal wrt  $<_{T_i}$ , there is a 1-1 function  $J_i$  s.t.

- 1. if (br(y), l) does not contain 0 then  $(br(J_i(y)), m)$  does not contain 0.
- 2. if l(y) = 0 and  $(br(y), l) \in \mathcal{F}_n(Q)$  then  $m(J_i(y)) = 0$  and  $(br(J_i(y)), m) \in \mathcal{F}_n(Q)$ ,
- 3. if l(y) = 0 and  $(br(y), l) \notin \mathcal{F}_n(Q)$  then  $m(J_i(y)) = 0$  and  $(br(J_i(y)), m) \notin \mathcal{F}_n(Q)$ .

Since  $B((T,l)) \leq B((U,m))$ , there exists  $B_{(U,m)}(j) \in B((U,m))$  s.t.  $B_{(T,l)}(0) = (\bar{T}_0,\bar{l}) \leq_{\bar{G}} B_{(U,m)}(j) = (\bar{U}_i,\bar{m})$ . Then set  $I_0$  by the embedding  $T_0 \to U_i$ .

 $(\bar{U}_j, \bar{m})$ . Then set  $I_0$  by the embedding  $T_0 \to U_j$ . Suppose that  $I_i$  has been defined,  $y \in T_i$  is maximal. If either (1) br(y) does not contain 0 or (2) l(y) = 0 and  $(br(y), l) \in \mathcal{F}_n(Q)$  then  $(br(y), l) \leq_G (br(J_i(y)), l)$ . Thus extend  $I_i$  with an embedding of br(y) into  $br(J_i(y))$ .

Suppose that (3) l(y) = 0 and  $(br(y), l) \notin \mathcal{F}_n(Q)$ , then from induction hypothesis  $m(J_i(y)) = 0$  and  $(br(J_i(y)), m) \notin \mathcal{F}_n(Q)$ . Thus from the assumption,  $B((T, l)) \leq B((br(J_i(y)), m))$  and there exists j s.t.  $B_{(T,l)}(i+1) \leq_{\bar{G}} B_{(br(J_i(y)),m)}(j)$  via an embedding K. Then  $I_i$  can be extended on  $br(y) \cap T_{i+1}$  with K, and the induction hypothesis is preserved.

**Proof of induction step for theorem 2.7** Let  $(T,l) \in \mathcal{M}_n(Q) - \mathcal{F}_n(Q)$  and  $S = \{x \in T \mid l(x) = 0 \text{ and } (br(x),l) \in \mathcal{M}_n(Q) - \mathcal{F}_n(Q)\}$ . For each  $s,t \in S$  s.t.  $s <_T t$ ,  $B((br(s),l)) \ge B((br(t),l))$  by an identity embedding.

If (br(x), l) does not contain 0 then  $(br(x), l) \in \mathcal{F}_n(Q)$ . Thus S (wrt  $<_T$ ) is an infinite tree of the height  $\omega$ .

Since  $B((T,l)) \in \mathcal{P}(S_{n+1}(Q^+ \cup \mathcal{F}_n(Q)))$ ,  $\{B((U,m)) \mid (U,m) \in \mathcal{M}_n(Q) - \mathcal{F}_n(Q)\}$  is a BQO, thus well-founded. Then there exists  $s \in S$  s.t. for each  $t \in S$  with  $s <_T t$   $B((br(s),l)) \not> B((br(t),l))$  (thus  $B((br(s),l)) \equiv B((br(t),l))$ ). From lemma 2.3,  $(br(s),l) \leq_{\widetilde{G}} (br(t),l)$ . But since  $(br(s),l) \in \mathcal{M}_n(Q) - \mathcal{F}_n(Q)$ , from definition there must be an infinite sequence  $s = s_0 <_T s_1 <_T \cdots s$ .t.  $(br(s_i),l) >_{\widetilde{G}} (br(s_{i+1},l))$  for each i. This is contradiction.

### 3 Simple gap termination for term graph rewriting systems

A reduction  $\to$  is terminating if there is no infinite sequence s.t.  $s_1 \to s_2 \to \cdots$ . Simple termination [Der82] is the frequently used criteria for a term rewriting system. For a TGRS (on possibly cyclic term graphs), the naive extension of simple termination based on Kruskal-type theorem on infinite trees [NW65, Lav78] does not work well. Let  $R = \{a(a(b(x))) \to a(b(x))\}$ . Then R is terminating. R rewrites a term graph y: a(a(b(y))) to y: a(b(y)), but  $unfold(y: a(a(b(y))) \geq unfold(y: a(b(y)))$  and  $unfold(y: a(a(b(y))) \leq unfold(y: a(b(a(b(y))))) = unfold(y: a(b(a(b(y)))))$ , because only fairness of occurrences of a, b on each path relates to  $\leq$ .

**Definition 3.1** [JKdV94] A term graph s is a finite directed graph satisfying:

- 1. s has a root.
- 2. each vertex of s has a label (function symbol) which has a fixed arity.

An  $\omega$ -term obtained by unfolding s is denoted unfold(s). A term graph rewriting system (TGRS, for short) R is a finite set of rewrite rules  $l \to r$  which are pairs of acyclic term graphs l, r s.t. l is not a variable and  $V(l) \supseteq V(r)$ .

Roughly speaking, reduction relation  $\rightarrow$  is defined similar to those which of a term rewriting system, except that a TGRS regards a variable as an address. For precise definition, please refer [JKdV94, AK94]. We will consider reduction  $\rightarrow$  of a TGRS on possibly cyclic term graphs<sup>4</sup>.

<sup>&</sup>lt;sup>4</sup>The definition of reduction of TGRS on a cyclic term graph requires some unfolding mechanism for a term graph. For instance, when the rule  $a(x) \to x$  is applied on a term graph y : a(y), [JKdV94] asserts y : a(y) as the result of the reduction. This requires some unfolding mechanism by default - otherwise, the result would be y : y. However this mechanism is not explicitly defined in literatures. Our termination criteria - simple gap termination (for a TRS see [Oga94]), on which unfolding does not effect - is a safer choice.

**Theorem 3.1** Let  $R = \{l \to r\}$  be a TGRS. Assume that a set of function symbols is totally ordered. If there is a QO < on ground term graphs s.t.

- 1. s > t implies C[s] > S[t] for each context C[].
- 2.  $C[s] \geq s$  where each function symbol f on a path from the root of C[s] to the root of s satisfies  $f \geq root(s)$ .
- 3. For each ground term graphs  $s, t, s \xrightarrow[l \to r]{\lambda} t$  (i.e., reduction at the root by the rule  $lr \to r$ ) implies s > t
- 4. s > t implies  $unfold(s) \neq unfold(t)$ .

Then R is terminating.

**Proof** Define a QO  $\leq_{uf}$  on  $\omega$ -trees by:  $unfold(s) \leq_{uf} unfold(t)$  if  $s \leq t$ . From (4), s > t implies  $unfold(s) >_{uf} unfold(t)$ . From (2),  $C[unfold(s)] \geq_{uf} unfold(s)$  if each function symbol f on a path from the root of C[unfold(s)] to the root of s satisfies  $f \geq root(unfold(s))$ . Since unfold(s) has repeated patterns (produced by cycles in s) except for its downward-closed finite subset, thus  $C[unfold(s)] \geq_{uf} unfold(s)$  and transitivity implies  $\leq_{uf} \subseteq \leq_G$  on  $\omega$ -trees obtained by unfolding finite term graphs.

Suppose there exists an infinite reduction sequence  $s_1 \to s_2 \to \cdots$ . Without loss of generality, we can assume that each  $s_i$  is a ground term graph. Thus from  $(1),(3), s_1 > s_2 > \cdots$  and  $unfold(s_1) > uf$   $unfold(s_2) > uf \cdots$ . However, from theorem 2.2 there exists i, j s.t. i < j and  $unfold(s_i) \le_G unfold(s_j)$ . This is contradiction.

Then  $y: a(a(b(y))) \to y: a(b(y))$  for  $R = \{a(a(b(x))) \to a(b(x))\}$ , and  $unfold(y: a(a(b(y)))) >_G unfold(y: a(b(y)))$  with a > b.
