日本蛋白質構造データバンク (PDBj) では、蛋白質や核酸などの生体高分子の三次元立体構造を、国際蛋白質構造データバンク (wwPDB) のメンバーの一員として、品質管理を行いながら登録・編集業務を行っている[1,2]。その一方で、生体高分子の立体構造データ[3]という、テキストや DNA 配列のような discrete でない情報（アナログ的な情報）に対して、その分類と検索を行う仕組みを開発し公開している[4,5]。講演では、特に、(i) 蛋白質の全体の構造（フォールド）の分類と類似性検索[6,7]、(ii) 蛋白質の局所的な機能部位の分類と類似性検索[8]、(iii) 蛋白質の分子表面の類似性検索[9-11]、について、その手法の原理とサービスおよび研究への応用を紹介する[12]。

Pattern recognition for Protein three-dimensional structures:
Similarity search of protein folds, local atomic arrangements, and molecular surfaces

The Protein Data Bank Japan (PDBj) curates, edits and distributes protein three-dimensional (3D) structural data as a member of the worldwide Protein Data Bank (wwPDB) and currently processes about 25-30% of all deposited data in the world [1, 2]. In addition to prepare the description formats and the viewers of those structural data [3], several tools and services have been developed for functional annotations from those protein 3D structures [4,5]. In particular, we have developed the algorithms of (i) rapid and correct similarity search of protein folds [6,7], (ii) very rapid comprehensive atomic structural alignment of functional sites [8], and (iii) molecular surface comparison with physicochemical properties [9-11]. Several examples of the applications to annotate the protein unknown functions will be shown [12].
